How can I handle cases where the user enters an empty name in my C++ program?
I don't want the program to crash or behave incorrectly.

Good thinking—this is exactly the kind of edge case your teacher expects 👍

✅ Simple Solution: Check for Empty Input

After taking input, just validate it before continuing.

🔧 Updated Code Snippet

C++

```
string name;

cout << "Enter your name: ";
```

My program gives the same roast every time I run it.
I am using rand() but it doesn't seem random.
What is the issue and how can I fix it?

This is a **classic C++ mistake**—and actually perfect for your "bug fixing" requirement 👌

❌ The Problem

`rand()` is **not truly random by default.**
If you don't initialize it, it uses the **same starting seed every time**, so:

👉 You get the **same sequence of numbers**
👉 Which means the **same roast every run**

The program works, but I want to replace {name} in the selected roast with the actual user input.
Can you help me implement that in C++?
Also explain the logic simply.

You're on the right track—this is the key step that makes your program dynamic.

✅ C++ Code (with `{name}` replacement)

C++

```
#include <iostream>
#include <vector>
#include <string>
#include <cstdlib>
#include <ctime>
```

Can you improve the previous C++ program by storing multiple roast templates in a vector?
Each template should include a placeholder like {name}.
The program should randomly select one roast each time it runs.

Nice—this is exactly the kind of improvement your assignment wants 👌

Here's the upgraded version with:

- ✅ Multiple roast templates (using `vector`)
- ✅ `{name}` placeholder
- ✅ Random selection

✅ Improved C++ Program

I want to create a simple C++ program that generates funny roast messages.
It should take the user's name as input and print a roast using that name.
Can you give me a basic version of this program?

Here's a **basic beginner-friendly C++ program** that generates a simple roast using the user's name:

✅ Basic Version (Single Roast)

C++

```
#include <iostream>
#include <string>
using namespace std;
```
